Live Monitoring System

How do I integrate the Live Monitoring System on my root server?

In this article we are explaining how to use the EUserv Live Monitoring System (LMS) on your server.

The following steps are required to use LMS on your server:

- Download the LMS from our servers via wget: wget --no-check-certificate
 - https://cdn.euserv.com/ressources/lms/live_monitoring_system
- Copy the LMS to its point of destination and make it executable: mv live_monitoring_system /usr/local/bin/live_monitoring_system && chmod 700 /usr/local/bin/live_monitoring_system
- Add the following line to the file /etc/crontab
 echo "*/5 * * * * root /usr/local/bin/live_monitoring_system" >> /etc/crontab
- Make sure you have installed "curl" and the cron service is running and loaded at the system start.

Debian

update-rc.d cron enable 2

Redhat/CentOS

chkconfig crond on

Done. Now you can see the status of your server in the customer center (after selecting your server contract).
