

Live Monitoring System

How do I integrate the Live Monitoring System on my root server ?

In this article we are explaining how to use the EUserV Live Monitoring System (LMS) on your server.

The following steps are required to use LMS on your server:

- Download the LMS from our servers via wget:
`wget --no-check-certificate https://cdn.euserv.com/ressources/lms/live_monitoring_system`
- Copy the LMS to its point of destination and make it executable:
`mv live_monitoring_system /usr/local/bin/live_monitoring_system && chmod 700 /usr/local/bin/live_monitoring_system`
- Add the following line to the file /etc/crontab
`echo "*/*5 * * * * root /usr/local/bin/live_monitoring_system" >> /etc/crontab`
- Make sure you have installed "curl" and the cron service is running and loaded at the system start.
Debian
`update-rc.d cron enable 2`
Redhat/CentOS
`chkconfig crond on`

Done. Now you can see the status of your server in the customer center (after selecting your server contract).
